Observation of Student Teacher (Form 1)

Student	Haaris Jamil	Date	13th November, 2026
Class / Year level	Year 10	Subject	Science

Pre-Observation Discussion

Student teacher completes the first column and discusses prior to lesson observation.

Pre-Observation		Evidence from Observation
What exactly do you want observed and why? What do you want the observer to notice?	The effectiveness of the design task. Are my instructions sufficiently clear for the students to undertake the task successfully? Is the planned activity appropriate given the time constraints, the available materials, and the conceptual understanding built through this unit? I would also appreciate feedback on how well I am able to support students through this task, by asking questions, giving suggestions or encouragement, when needed, while affording them the freedom to develop their own ideas and designs.	The lesson was another great success. During the lesson introduction, students were encouraged to make links between the previous lesson - electricity generation (through the movement of a magnetic field relevant to a coil of wire) and how the science is utilised (the technology) in the real world. The timing went well; students all created their designs in the given time. A possible addition would be for the students to showcase their creations to their peers. A range of materials was provided to offer student choice.
What outcomes are you expecting?	I expect the task to give groups enough direction to get started and enough freedom to build different prototypes. I want feedback on where my instructions or support helped groups turn their ideas into something they could test, and where I could have given more or less guidance.	There was the right amount of guidance as all groups completed the task with a number of different designs being created. This showed that the guidance provided was open-ended, providing the opportunity for the students to be creative with their thinking.

Post-Observation Discussion

Notes can be added through the lesson by the observer and expanded on during the discussion.

Students

- What are the intended learning outcomes for this lesson or unit of work?
- What information do you have about how students achieved the intended learning outcomes?
- What are their remaining misunderstandings? / What are the next steps in learning?

Teaching

Student teacher reflection of the observation focus	I wanted to see whether my instructions gave groups enough direction to get started while leaving the design decisions to them. Lee noted that all groups completed the task in the time available and came up with different designs. That suggests the guidance was clear without being too prescriptive. I would keep the choice of materials and continue using questions and suggestions to help groups think through their own ideas.
Observer's key pieces of evidence of what was noticed	Engagement of students. Opportunity for creativity. Relevance to topic, extending the science principles to technological use.
Areas of strength	Passion for subject, preparation of equipment and materials. Use of real-life context.

Student Teacher Evaluation

Student evaluation of lesson taught and observation discussion	The class built six turbine prototypes, including some quite sophisticated designs. The available materials limited what students could build, but working within those limits was part of the challenge. Students could also explain how they might improve their designs. We now have six prototypes to test on the field trip, so we can compare what works and see whether their proposed changes would help. Lee's suggestion to let groups showcase their work is worth trying. Next time I would set aside a few minutes for each group to show one design feature and explain why they chose it.
